I Guess It's Better than the SETI Stuff We Geeks Did...

Jamais over at WorldChanging has a post on a massive computer project, similar to the old SETI project (yes, it's still going...same folks (BOINC) behind both projects) that has screensave-crunched a lot of data looking for an alien signal. The BBC/Climateprediction.net screensaver though uses all of this microcomputer power to crunch simulations/models on pieces of climate change data.

Pretty interesting, and probably a better use of computer power than the looking for the proverbial needle in a haystack, eh?
