A new report tomorrow coming from the Network for New Energy Choices. NNEC also has an interesting project being put together called the National Energy Research Database (heh, NERD) that will be coming online in August.

The Rush to Ethanol makes the case that there is no silver bullet for fossil fuel dependence, energy independence, or curbing greenhouse gas emissions. Ethanol cannot be produced in quantities large enough to displace petroleum without unacceptable costs to public health and the environment, as well as to taxpayers. Without reform in the transportation sector fuel demand will continue to outpace fuel supply.
