

Alternate Sources of Energy

Posted by [Heading Out](#) on April 27, 2005 - 2:17pm

I was trying, in response to the earlier comment, to find a reference to [the biodiesel plant](#) announcement this week, when I tried the NYT and found that [tabletop nuclear fusion](#) may have happened.

While that development will not likely have any critical impact on fuel supplies in my lifetime it is reassuring that progress continues to be made, and studies are having some result.

In regard to the biodiesel issue, this was on the agenda for comment, since, apart from the Missouri plant plans, there is also some movement in the UK toward installing a plant. There however they plan on using an African plant as the source material, rather than the rape seed which is quite common in the UK. (It is the yellow flower you see covering a lot of fields there at this time of year). Supplies, however, are, in the short term, likely to be quite small. But as with a lot of things, a little here and a little there all adds up.
